...

****Quick Log**** – student, subject, duration, log type
(Planned/Spontaneous/Field Trip/Peer-Teaching/Completed), notes.

****Compliance & Reports**** – per-subject pacing status, 6-subject checklist, PDF export.

****Data:**** `students`, `academic\_years` (global – see architecture update below), `student\_academic\_years`, `subjects`, `daily\_logs`

****Architecture update – adopted from actual build:**** `academic\_years` is now a ****global**** table (name, start_date, end_date) shared across the whole family, rather than one row per student. A `student\_academic\_years` junction table maps each student to a year and assigns their `grade\_level` for that specific year. This is a genuine improvement over the original per-student design – the calendar dates are the same for both kids, only grade level differs – and is now the canonical design going forward.

****Done when:**** you can create both students, start an academic year, log activities daily, and see accurate hour totals against the 875-hour goal.

Phase 1.5 – Curriculum Import + Automated Scheduling –  Done (CSV bulk import still pending)

****Screens:**** Curriculum & Standards Library, Add Curriculum Items, Today (checklist), Calendar auto-scheduler

****Curriculum & Standards Library:****

...

My curricula		Standards reference	
	BookShark Level A	Reading · calendar-paced · 36 wks · 24 items	>
	Math-U-See Alpha	Math · mastery-paced · 30 lessons	>
[+ Add curriculum]			

...

****Curriculum-agnostic design:**** a curriculum record is just `title + subject + pacing\_type`. Switching brands or adding a fully online course is just adding a new curriculum record with `delivery\_mode` set appropriately.

****Architecture update – adopted from actual build:**** curriculum assignment is now formalized as a `student\_curricula` junction table (student ↔ active curriculum), rather than an implicit link – this correctly allows the same curriculum to be reused across students, or different students to run different curricula in the same subject.

****Automated Curriculum Scheduling (built, more advanced than originally scoped):**** rather than simple linear weekly pacing, the actual build lets you pick a start date and specific days of the week (e.g. M/W/F), then automatically maps sequential curriculum items onto the calendar as "Planned" daily logs – skipping weekends and globally-defined holidays automatically. This is better than the original plan and is now the canonical scheduling model.

****New – Holidays:**** a `holidays` table (name, date, is_recurring) backs the auto-scheduler's holiday-skipping behavior and should also feed the Calendar screen (Phase 2.5) so holidays are visibly marked, not just silently skipped.

****New – Curriculum retire, not delete**** *(Feature #4 from the roadmap review)*: add `curricula.status` (`active` / `retired`). When you switch curriculum brands mid-year, the old curriculum is marked `retired`, never deleted – its `curriculum\_items` and their links to completed `daily\_logs`/`curriculum\_item\_standards` stay fully intact for your compliance history, while the new curriculum takes over pacing going forward. Build this into the CSV bulk import feature now, since retrofitting it later is more expensive.

****Still pending:**** Curriculum Bulk Import via CSV – UI to upload a formatted CSV, backend parsing into `curriculum\_items` rows.

****Data:**** `curricula` (+ `delivery\_mode`, `pacing\_type`, `status`), `curriculum\_items` (+ `item\_type`, `external\_url`), `student\_curricula`, `holidays`

****Done when:**** both curricula are loaded, the day-of-week auto-scheduler correctly skips weekends/holidays, and CSV bulk import successfully creates a full curriculum's items in one action.

Phase 1.75 – Differentiators – ☒ Done (family-subject flag pending)

****Screens:**** Standards Coverage Checklist (part of Compliance & Reports), Unit Study Mode, Shared/Multi-Student Log

****Compliance & Standards (expanded):****

...

Milli · 2026-2027	
Reading ✓ Math ✓ Health  behind Science ✓	
Standards coverage – Reading (WI Standards, Gr. 1)	
✓ RF.1.3 – decode CVC & multisyllabic words (3)	
✓ RL.1.2 – retell stories, identify lesson (2)	
o W.1.1 – write opinion pieces w/ reasons (0)	
[↓ Export compliance PDF]	

...

****Shared/multi-student log (built, confirmed working):**** select both students on one Quick Log or scheduled entry; the app writes one linked record per student via `shared\_activity\_group\_id`. Confirmed behavior: checking the box for one student in the Calendar instantly updates the linked log for siblings in that group too.

****Unit Study Mode:**** one topic, differentiated objectives per child. Ships with a starter library plus fully custom option.

****New – Family subject default**** *(Feature #3 from the roadmap review, requested now)*: add `subjects.is\_family\_subject` (boolean). Subjects flagged this way (typically History, Science, Read-Alouds) default the Quick Log / scheduler's student selector to ****both**** students automatically, instead of requiring a manual multi-select every time – reflecting how experienced multi-age homeschoolers actually teach: topic-based subjects combined, skill-based subjects (Math, phonics) kept separate per child by default.

****Standards tagging (automatic):**** unchanged – AI-suggested, human-confirmed, per the core design principle.

****Data:**** `standards`, `curriculum\_item\_standards` (+ `ai\_suggested`, `confirmed`), `unit\_studies`, `unit\_study\_templates`, `unit\_study\_objectives`, `daily\_logs.shared\_activity\_group\_id`, `daily\_logs.unit\_study\_id`, `subjects.is\_family\_subject` *(new)*

****Done when:**** standards suggestions appear automatically, the coverage checklist reflects real progress, shared logging is confirmed instant across siblings, and family-subject defaulting is live.

Phase 1.9 – Account & Access Management –  Done

****Screen:**** Account Management (Owner-only)

...

Account management	
--------------------	--

👑 you@gmail.com		
Owner · active		
✅ wife@gmail.com		
Co-owner · active	[Manage]	
💛 milli.student@gmail.com		
Student · linked to Milli		
invite pending	[Resend]	
[+ Invite account]		

Only the Owner can invite accounts or change roles – enforced by RLS, not just hidden UI. Inviting uses Supabase's server-side admin invite API; a matching `profiles` row is created with the chosen `household\_role` and, for students, `linked\_student\_id`.

Confirmed built (bonus, not originally scoped): a safety lock mathematically guarantees the final Owner account cannot be deleted – good defensive design, worth keeping documented here since it's not obvious from the schema alone.

Data: `profiles.status` (`invited` / `active`)

Done when: you can invite your wife as co-owner and, later, student accounts linked to each child, and the Owner-cannot-be-deleted safety lock is verified.

Phase 1.95 – Gamification & Living Bio – ✅ Built (integrity fix pending confirmation)

(New phase, documenting features the actual build already shipped ahead of this plan – Living Bio and the reward system weren't in the original roadmap but exist in the codebase and are genuinely good additions.)

Living Bio: a chronological timeline on the student's profile recording milestones, interests, and goals, with attached media – a "Facebook-style" personal record distinct from the academic one.

Rewards: a `rewards` table (points_required, is_unlocked) tied to a student's `reward\_points`, visualized as a progress bar toward a goal on the student dashboard.

⚠️ Recommended fix, not yet confirmed by you – flagging again since it wasn't in your explicit "yes" list: research on gamification in learning contexts consistently finds that a heavy emphasis on extrinsic rewards can lead to students gaming the system to reach a reward faster, and can shift focus from the work itself to the reward. Right now, if `reward\_points` increment at the moment a student *submits* a log (before parent approval), that creates a direct incentive to over-log or pad entries. **Recommended fix:** `reward\_points` should only increment when

a parent approves the corresponding log in the Review Queue – never at self-submission. This is cheap to implement (move the increment from the insert trigger to the approval action) and closes a real integrity gap. Confirm you want this before it goes into the next prompt batch.

****Data:**** `living\_bio\_entries` (student_id, entry_type, description, date, media_url), `rewards` (points_required, is_unlocked), `students.reward\_points`

****Done when:**** Living Bio entries display correctly on the student profile, and reward points only move on parent-approved actions (pending your confirmation above).

Phase 2 – Portfolio, Media & Trips –  Done (double-counting fix required, new features pending)

****Screens:**** Media Upload, Trips & Vacations, Narration Capture

****Trips & Vacations:****

...

Trips & vacations	
[photo strip]	
Yellowstone National Park	
June 14-19, 2027 · Milli, Luci · 12 photos	
[Science] [Geography] · Theme: Ecosystems	
State Capitol Tour	
March 3, 2027 · Milli, Luci · 4 photos	>
[+ Log a trip]	

...

**** Critical fix required – trip hours double-counting:**** the actual build gives `trips` its own `hours\_credited` field, summed alongside `daily\_logs` in the compliance total. If a trip *also* has an associated `daily\_logs` entry (e.g. from the shared-logging flow), the same hours get counted twice toward your legal 875-hour requirement. ****Resolution** (per the "single source of truth for hours" principle in Section 1): ****** logging a trip should auto-create one `daily\_logs` row per involved student (split across `trip\_subjects`, see below), and `trips.hours\_credited` becomes a ****read-only, computed**** display field – the sum of its linked `daily\_logs` rows – never independently editable and never separately added into the compliance total. This must be fixed before you rely on this data for a real filing.

****New – Multi-subject tagging**** ***(Feature #2 from the roadmap review)*:** replace the single `trips.subject\_id` with a `trip\_subjects` join table, so a single trip (or, more generally, any multi-subject activity) can be

tagged to Science *and* Social Studies *and* Health simultaneously – matching how real activities like cooking or a field trip actually work. Decision: logged time **splits** across tagged subjects rather than duplicating in full to each, consistent with the no-double-counting principle.

****New – Trip theme field**** *(Feature #6 from the roadmap review)*: a short `trips.theme` text field (e.g. "Ecosystems," "Colonial history"), set when logging the trip. Validated by roadschooling research – experienced roadschooling families deliberately align travel with a topic already being studied rather than treating trips as disconnected from curriculum.

****Media upload, Narration capture, Benchmark parity check:**** unchanged from original plan, confirmed built.

****Data:**** `trips` (+ `theme`, `hours\_credited` now computed), `trip\_subjects` *(new, replaces `trips.subject\_id`)*, `trip\_students`, `media\_attachments`, `narrations`, `benchmark\_references`, `benchmark\_progress`

****Done when:**** a trip's hours appear exactly once in the compliance total (verified by a manual audit of a test trip), multiple subjects can be tagged to one trip, and a theme is captured per trip.

Phase 2.5 – Calendar & Google Calendar Sync – ● Partial (Google Cloud setup deferred)

****Screens:**** Calendar (Month/Week/Day, confirmed built with mobile dot-condensing), Google Calendar Sync Settings

Calendar views are built and confirmed mobile-optimized (colored dots instead of text blocks on small screens). Holiday markers (from the new `holidays` table in Phase 1.5) should be layered onto this view, not just used silently by the scheduler.

****Google Calendar sync – one-way (app → Google), as decided.**** Not yet started – Google Cloud OAuth setup was deferred by you.

****Data:**** `google\_calendar\_connections` (encrypted tokens), `daily\_logs.google\_event\_id`, `curriculum\_items.google\_event\_id`

****Done when:**** the Calendar visibly marks holidays, and logging a planned item or trip creates a matching Google Calendar event without duplicating on re-sync.

Phase 3 – AI-Assisted Grading + Closed-Loop Mastery Pacing – ● Partial (upload trigger missing)

****Screens:**** Work Sample Review (confirmed built and functional)

****Verified status:**** the `work\_samples` schema is fully implemented, and the Review UI correctly displays a draft's image, AI feedback, and suggested score, with working edit/confirm actions that update the database. ****What's missing:**** there is no UI for a student to actually upload a photo of their work, and no backend route that sends that photo to the Anthropic API to generate the initial draft. The "AI Drafts" half of "AI drafts, human confirms" isn't wired up yet – only the "human confirms" half exists.

****Mastery pacing recalibration:**** unchanged from original plan – depends on confirmed `work\_samples` scores, which in turn depend on the upload trigger being built first.

****Data:**** `work\_samples` (image_url, ai_feedback, ai_suggested_score, confirmed_score, status) – schema complete; `curricula.pacing\_type` driving pacing logic

****Done when:**** a student (or parent) can photograph a worksheet, it produces an AI-drafted score/feedback automatically, and it appears in the Review Queue for confirmation.

Phase 4 – Transcript System – ☐ Not started

****Screens:**** Transcript (confirm-based)

Unchanged from original plan – explicit, parent-confirmed entries only; a separate non-final draft/preview view; on-demand (not live) GPA calculation.

****Data:**** `transcripts` (student_id, academic_year_id, subject_id, credit_earned, grade_mark, confirmed_date)

****Done when:**** a confirmed grade/credit entry is added and reflected correctly, with the draft/preview clearly separated.

Phase 5 – Year-End Portfolio: PDF + Highlight Slideshow – ☒ Fully done

****Verified status:**** both halves confirmed working. The `/export` screen's PDF generation is fully functional with modular section toggles. The highlight slideshow is ****completely built and functional**** – `SlideshowGenerator.tsx` fetches portfolio-flagged media and uses `@ffmpeg/ffmpeg` (WebAssembly) to render and download an `.mp4` directly in the browser. No further work needed on this phase.

****Data:**** unchanged from original plan.

Phase 6 – Future / Not Scoped Now

Explicitly deferred: two-way Google Calendar sync, full video editing, multi-family/community features, monetization.

Cross-Cutting Feature – Unified Review Queue – ● Partial (work_samples only)

****Verified status:**** a Review Queue screen exists and works correctly for `work\_samples` (AI grading confirmation). ****It does not yet cover the other three sources**** originally scoped: student self-submitted `daily\_logs`, AI-suggested `curriculum\_item\_standards`, or AI-tagged `narrations`. Right now, anything a student self-submits has no visible review path – this is the single highest-priority gap in the whole app, since data is silently accumulating unreviewed.

...

Review queue		4 items need confirmation	
	Luci logged: "Read 2 ch. of Frog and Toad"		
	Self-submitted · Reading · 20 min	[Review]	
	Suggested standard for "Reader ch. 4"		
	RL.1.2 – retell stories, ID lesson	[Review]	
	Work sample graded: Math worksheet		
	Milli · AI suggested: Mastered	[Review]	
	Narration skill tag: hamster & cheetah story		
	Suggested: Sequencing	[Review]	

...

****Immediate priority:**** extend the existing Review Queue component to also query `daily\_logs.pending\_parent\_approval`, `curriculum\_item\_standards.confirmed`, and `narrations.tag\_confirmed`, rendering all four types in one inbox rather than only `work\_samples`. This is a convenience view over existing fields, not new schema.

****Schema (already exists, confirmed correct):****
- `daily\_logs.pending\_parent\_approval` (boolean, default `false`; forced `true` by RLS policy on student-role inserts)
- `narrations.tag\_confirmed` (boolean, default `false` once an AI skill tag is suggested)
- `curriculum\_item\_standards.confirmed`, `work\_samples.status`

Cross-Cutting Feature – Standards Gap Dashboard *(new, Feature #5 from the roadmap review)*

A dedicated screen, not just an inline checklist, showing standards progress *and actively flagging gaps* rather than requiring you to notice them yourself.

...

Standards gaps – Milli, Reading, Grade 1	
Coverage: 8 of 12 standards touched 	
▲ W.1.1 – write opinion pieces w/ reasons Not covered · year 62% elapsed Suggested: tag to "Reader ch. 5 – opinion writing" (unscheduled curriculum item)	
▲ SL.1.1 – participate in collaborative discussions · Not covered · year 62% elapsed	

...

Logic: for any required standard with zero `curriculum\_item\_standards` links once the academic year is more than halfway elapsed, surface it here with a suggested existing (but not-yet-tagged) curriculum item that could plausibly close the gap – computed by matching the standard's subject/grade against untagged `curriculum\_items` in the same subject. This connects data you already compute (Standards Coverage + Pacing Radar) into one proactive view instead of two passive ones.

****Data:**** no new tables – a computed view over `standards`, `curriculum\_item\_standards`, and `curriculum\_items`.

****Done when:**** the dashboard correctly identifies an uncovered required standard past the halfway point of the year and suggests a real, untagged curriculum item to close it.

3. Complete Data Model (reconciled with actual build)

| ****Co-owner**** | Your wife | Full read/write on all students and data, minus account-level settings |
| ****Student**** | Milli/Luci, later | Read access to their own compliance progress, curriculum, and narrations; write access to their own logs/narrations/work samples, always flagged ``pending_parent_approval`` until confirmed |

Implementation

- Supabase Auth (email/password), ``profiles`` table extending ``auth.users`` with ``household_role`` and ``linked_student_id``.
- ****Row Level Security (RLS)**** enforces all of this at the database level. Confirmed correct: ``pending_parent_approval`` is forced ``true`` by the policy on student-role inserts, not by client code.
- ****Reward integrity rule (new):**** RLS/application logic should ensure ``students.reward_points`` only increments as a side effect of a parent's approval action in the Review Queue – never on the student's own insert. See Phase 1.95.

Data security in the cloud

- Encryption in transit (Vercel TLS) and at rest (Supabase default).
- Secrets only in environment variables, never in code.
- Backups: Supabase's free tier has limited retention – worth upgrading to Pro for point-in-time recovery once this holds a full year of real records.
- No third-party data sharing beyond Supabase, the Anthropic API (for AI features), and Google (calendar event data only, once Phase 2.5 sync is built).

5. Hosting on Your GoDaddy Domain

You're keeping GoDaddy as registrar and pointing DNS at Vercel, which hosts the app.

1. In Vercel, add your domain (a subdomain like ``planner.yourdomain.com`` is recommended, to avoid touching your root domain's other DNS records).
2. Vercel gives you a CNAME target (subdomain) or A record IP (root domain).
3. In GoDaddy → My Products → DNS, add that record.
4. Wait for DNS propagation.
5. Vercel automatically issues a free SSL certificate once verified.

No ongoing cost beyond your existing GoDaddy domain fee.

6. Technical Implementation Reference

Accounts, environment variables, and initial setup steps are unchanged from earlier planning – GitHub, Supabase, Vercel, Anthropic API, Google Cloud (for Phase 2.5), and your GoDaddy domain. Refer to your project's

own setup notes for exact account details already configured; this section is intentionally not repeated here now that the build is underway, to avoid this document drifting out of sync with what's actually configured.

7. Build Order Checklist (reconciled with verified codebase state)

- [x] Phase 1 – MVP
- [x] Phase 1.5 – Curriculum + Automated Scheduling *(CSV bulk import still pending)*
- [x] Phase 1.75 – Differentiators *(family-subject flag pending)*
- [x] Phase 1.9 – Account & Access Management
- [x] Phase 1.95 – Gamification & Living Bio *(reward-on-approval-only fix pending your confirmation)*
- [x] Phase 2 – Portfolio, Media & Trips *(● double-counting fix required; multi-subject tagging + trip theme pending)*
- [] Phase 2.5 – Calendar + Google Calendar one-way sync *(Calendar UI done; Google Cloud OAuth setup deferred)*
- [] Phase 3 – AI-Assisted Grading *(● schema + Review UI done; AI upload trigger missing)*
- [] Phase 4 – Transcript System
- [x] Phase 5 – Year-End Portfolio *(fully verified: PDF + slideshow both working)*
- [] Review Queue – expand beyond work_samples to all 4 pending-review sources
- [] Standards Gap Dashboard *(new)*
- [] GoDaddy domain connected
- [] Wife's co-owner account added
- [] Student accounts added

****Immediate priority order, recommended:**** (1) Review Queue expansion – unblocks all pending student data, (2) Trip hours double-counting fix – protects the legal record, (3) Phase 3 AI upload trigger – completes an already-half-built feature, (4) new features 2/3/4/5/6 from the roadmap review, (5) Phase 2.5 Google Calendar, (6) Phase 4 Transcripts.
